Requirement: Use the provided `PowerBI_Data.xlsx` dataset to complete all tasks. Base your Power Query transformations, star schema, DAX measures, and visualizations on the data in this file.

Part A — Power Query : remove the two title rows, promote headers, clean text, fix date formats, convert prices and discounts, handle duplicate and invalid rows, and verify data Types

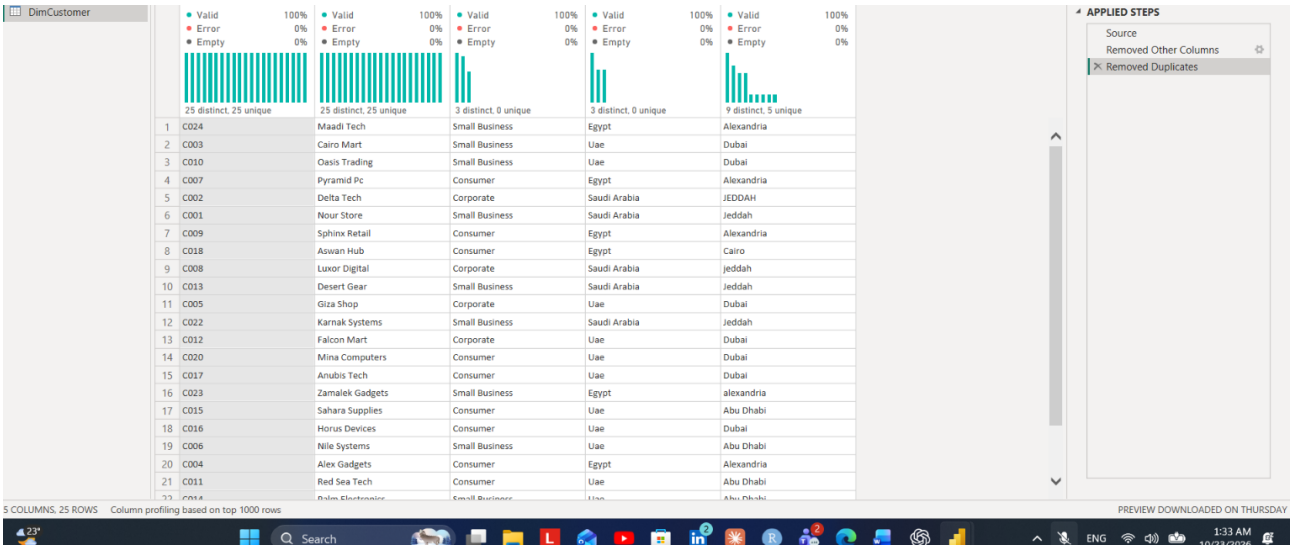

Applied Transformation Steps: Highlights the chronological sequence of operations in the Applied Steps pane, culminating in the Changed Type2 step. Following initial header promotion, top-row removal, and iterative text standardization (Trimmed Text, Cleaned Text, and Capitalized Each Word), this step explicitly converts OrderDate and ShipDate from mixed text formats into standardized **Date** data types (MM/DD/YYYY),

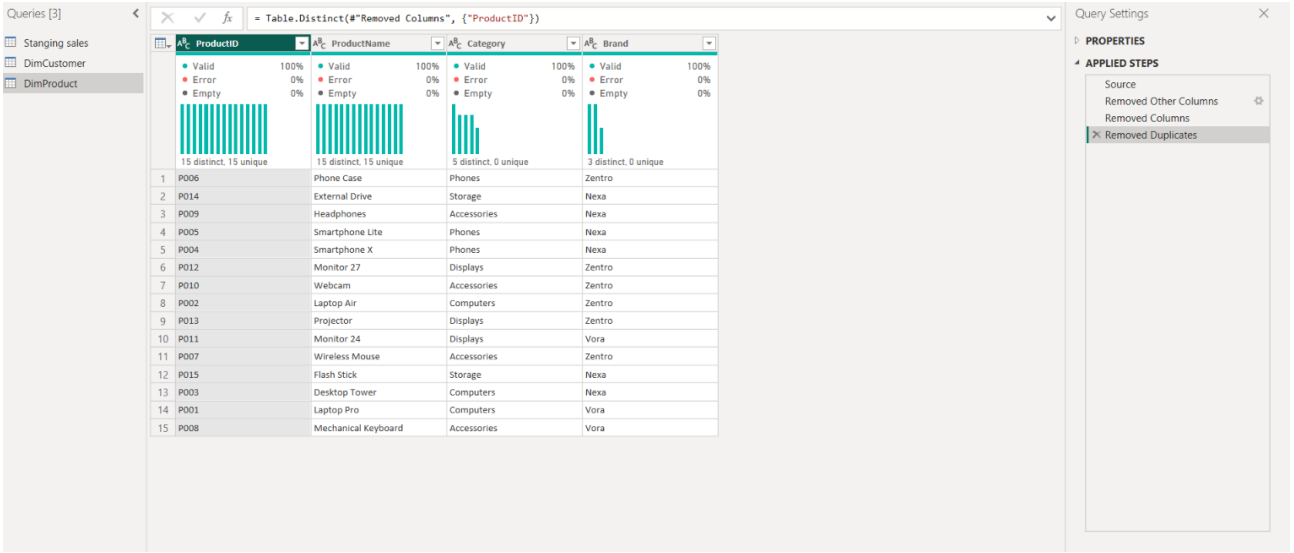

.

Part B — Star Schema : create `FactSales`, `DimCustomer`, `DimProduct`, `DimSalesRep`, and `DimDate`.

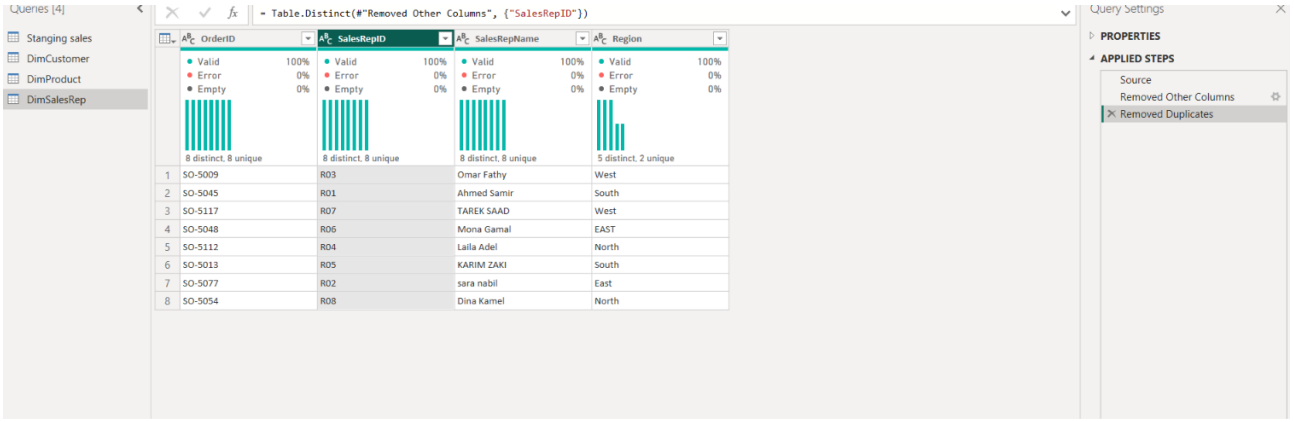

Create dim customer

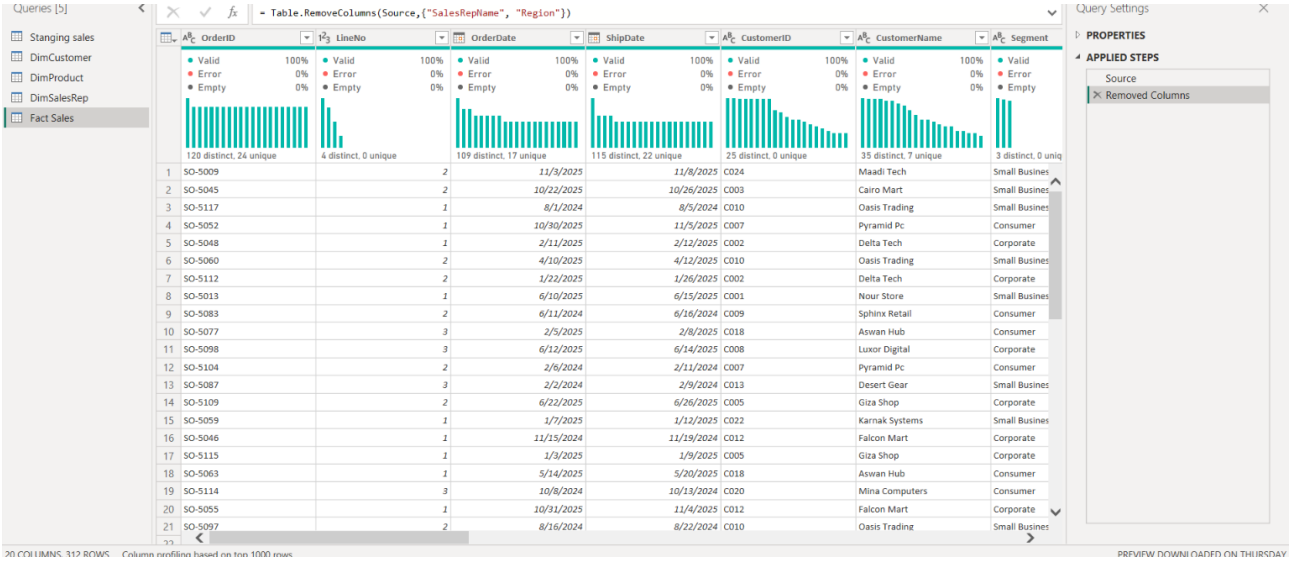

Create dim product

Create Dim Sales Rep

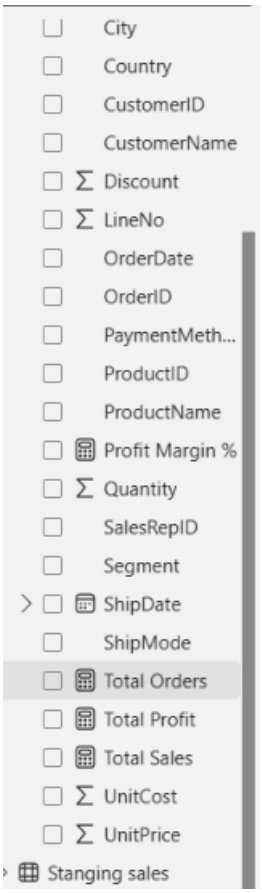

Create fact sales

Modeling view

Part C — DAX : create exactly four measures: Total Sales, Total Profit, Profit Margin %, and Total Orders.

Part D — Visualization : build a dashboard using descriptive fields from dimension tables.

Bonus tasks: year-over-year sales and an inactive ShipDate relationship.
